

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

THE LAS VEGAS SCIENCE CLUB.

THE second meeting of the Las Vegas Science Club was held January 8th. Mr. Frank Springer exhibited and commented upon some crinoids from the Burlington Limestone at Lake Valley, New Mexico. He also exhibited and discussed specimens of *Uintacrinus socialis*, Grinnell, which he had found beautifully preserved in the cretaceous of Western Kansas. He showed a number of plates to illustrate a memoir on this species, which will shortly be published in the *Memoirs* of the Museum of Comparative Zoology. The abundance and excellent preservation of the material had permitted him to determine many new facts regarding *Uintacrinus*; and after tabulating the characters of over 600 individuals it became evident that *U. socialis* of America and *U. westfalicus* of Europe were identical, the supposed specific distinctions being due to age and variation.

Mr. E. L. Hewett spoke on the ancient cliff-dwellings and communal buildings of the Pajarito district, New Mexico. He had for some years been engaged in the investigation of these, and presented a map showing their distribution, a number of plans and photographs, and a collection of objects obtained from the dwellings and burial mounds. The communal buildings of the Tehrega, Tsankiwi, Navakwee and Otow; mesas were described; the first of these was estimated to have contained nearly 1,500 rooms, being much larger than the buildings still in use at Taos. Mr. Hewett referred to the importance of preserving these ruins for systematic and careful examination, and the desirability of retaining as public property such important evidences regarding the early man of America as abounded throughout the district. To this end a bill is now pending in Congress, which provided for the retention of the district as a National Park.

NEW YORK SECTION OF THE AMERICAN CHEMICAL SOCIETY.

A STATED meeting was held at the Chemists' Club, 108 West 55th Street, on January 11th, Dr. C. A. Doremus, presiding, and 53 members present.

Dr. Parker reported progress for the Committee appointed to confer with the Bureau of Combustibles in regard to the storage of acids.

The Chair reported that the revision of the By-Laws was in the hands of the Executive Committee in accordance with the action taken at the November meeting. A resolution offered by A. C. Hale was then read as follows:

Resolved, That the New York Section of the American Chemical Society herewith extends a most cordial invitation to the Society to celebrate the 25th anniversary of its foundation next April in New York City, and the Chairman of the New York Section is hereby authorized and directed to appoint such local committees as he may deem expedient in order to aid in perfecting arrangements for such celebration."

The resolution was unanimously approved and the Secretary was instructed to formally extend the invitation to the Society at large.

Dr. T. O'Connor Sloane then read his paper entitled, 'Notes on Spheroidal State Evaporation,' with experiments.

Dr. McMurtrie made a report on the Mid-winter meeting just held in Chicago, to the effect that it had been very successful, and the visiting members were well entertained. One hundred and thirty-nine members were registered. Numerous applications for membership in the Society had been entered as a result of the interest aroused.

DURAND WOODMAN,
Secretary.

DISCUSSION AND CORRESPONDENCE.

NOTE ON VEGETO-ELECTRICITY.

IN SCIENCE, September 8, 1900, is an abstract of a paper, by Dr. Waller, on 'The Electrical Effects of Light upon Green Leaves,' which recalls an experience noted in 1888 in my physical laboratory work. In June of that year I asked a student to determine the magnetic elements at a certain place, just under the outer ends of the long branches of a low Norway maple. He reported that the magnetometer was in such continual tremor and slight shifting about that it was impossible to make accurate readings. This continued for hours; and was quite noticeable again some days subsequently

—so that the station was abandoned. This movement was not due to wind, nor to a magnetic storm, nor to any mechanical jarring of the earth.

Except an indefinite item in a newspaper, I have seen no mention of a similar experience.

To determine whether there is from trees such a discharge of electricity as might affect a delicate magnetic needle, I made (in 1895) a coil about 80 cm. diameter of fifty turns of wire, mounted on the end of a long pole, with a contact breaker and a telephone receiver in circuit, and had this coil held in such relation to large, dense limbs of trees as to enclose the lines of magnetic force from a discharge stream (if there be one) of electricity from the limb, selecting limbs in such direction as would make the coil when in proper relation lie in the magnetic meridian plane, determined by simple compass.

April 8th–12th, buds just swelling on deciduous trees, I tried a number of trees, including two or three evergreens. I could hear no disturbance in the telephone, in any position of the coil. Then putting the coil in the magnetic meridian, as explained above, to make the action (if any) stronger than mere variation of discharge, I had the circuit opened and closed. Still there was not the slightest effect perceptible. In the latter half of May, leaves quite fully developed on all except the various oaks, the experiments were repeated with the same negative results.

According to Dr. Waller's experiments, it would have been better to try my experiment in June (when the unexplained action was observed), rather than April and May, the leaves then being in fuller vigor and the temperature higher.

I. THORNTON OSMOND.

STATE COLLEGE, PA.,
January 21, 1901.

SCIENTIFIC EXPEDITION TO ICELAND, GREENLAND AND LABRADOR.

A GEOLOGICAL and geographical excursion in the North Atlantic is planned for the summer of 1901. Conditionally on the formation of a sufficiently large party, a steamer of about 1,000 tons, specially adapted for ice navigation, and capable of accommodating sixty men, will leave

Boston on or about June 26th and return to the same point on or about September 20th. The main object of the voyage will be to offer to the members of the excursion party opportunity of studying the volcanic cones and lava-fields, the geysers, ice-caves and glaciers of Iceland, the fiords and glaciers of the west coast of Greenland, and the mountains and fiords of Northern Labrador. Some attention will be paid to the hydrographic conditions of the waters traversed. Botanists, zoologists, ornithologists, mineralogists and those interested in other branches of natural history may pursue independent studies. A hunting party may take part in the expedition; it could be landed for a fortnight or three weeks in Greenland and for about the same period in Labrador.

Explanatory lectures on the regions visited will be given from time to time by the leader of the excursion, who will also act as guide on the Labrador coast where he spent the summer of 1900. It is expected that in Greenland and Iceland, specialists on the geology and physical geography of these countries will lead the party. Wherever possible the attempt will be made to increase the stock of existing information concerning the three regions. It is desirable, though not necessary, that applicants for membership in the party possess at least an elementary knowledge of geology. Citizens of other countries as well as of the United States are invited to participate in the expedition. A physician will accompany the party.

An inclusive fee of \$500 for each member will be charged, \$250 to be deposited with the leader of the expedition on or before March 15th, the balance to be paid on or before June 1st.

The trip will be under the direction of the writer, and applications for membership should be addressed to him.

R. A. DALY,

Department of Geology and Geography, Harvard University.

CURRENT NOTES ON METEOROLOGY.

REPORT OF THE CHIEF OF THE WEATHER BUREAU.

THE 'Report of the Chief of the Weather Bureau for 1900' devotes considerable space to forecasts. The beginning of storm forecasts for
